

SQL Server & SharePoint: Explore the Possibilities

SQL Server is a vital but often underutilized component in SharePoint environments. But it doesn't have to be. By taking advantage of the features available to you, you can maximize its contributions:

- Instead of having SharePoint create your SharePoint databases, you can pre-create them in SQL Server. When you pre-create a database, you can better control its infrastructure. You can create custom files and file groups in the database, and customize the size of the transaction log.
- By integrating SQL Server Reporting Services (SSRS) into your SharePoint infrastructure, you can greatly increase SharePoint users' options when accessing, analyzing and visualizing data. They can create and add SSRS reports to a PerformancePoint Services dashboard and deliver SSRS reports to a document library using the platform they already know. And a new web-based tool in the upcoming SQL Server "Denali" release will bring even more data analysis and visualization options for SharePoint users.

Our SQL Server and SharePoint experts can help you take advantage of these and other SQL Server features available to you. They'll help you achieve a more sophisticated SharePoint infrastructure that drives a more satisfied user base.
